RareBooksClub. Paperback. Book Condition: New. This item is printed on demand. Paperback. 190 pages. Dimensions: 9.7in. x 7.4in. x 0.4in.This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1912 Excerpt: . . . is not large. The type is confined to the southern part of the county and is usually developed adjacent to areas of Norfolk sand. In some cases it is probably formed from the latter type by erosion which has removed the sandy material from the surface so as to bring the underlying clay within the three-foot section. The type is adapted to general farm crops as well as truck crops. Table XVIII. Analysis of Norfolk Sandy Loam. , Total Pounds per Acre (. , , Limestone Soil Type Lab. No. Nitrogen Phos. Potash Calcium to correct. Acid Oxide acidity Norfolk Sandy Soil 2737 497 276 2852 736 92 Loam Subsoil 2738 940 985 8968 1880 489 Total 1437 1261 11820 2616 581 Samples 2737 and 2738 were taken two and three-fourths miles southeast of Roberts station. The surface soil consists of a gray to dark gray sand which grades in the lower depths into a yellowish gray loamy sand. The subsoil is a pale yellow loamy sand to sandy loam, passing into a yellow sandy clay at a depth of 18 inches. Fertility ot Norfolk Soils. These soils are notably low in all the principal elements of plant food. The Norfolk sand and coarse sand are extremely deficient. The coarse texture and incoherent nature of the soil and subsoil are conducive to a rapid loss of plant food by leaching. The organic matter is rapidly exhausted, and fertilizers are of doubtful value in the present...
